Frobenius algebras have gained a lot of attention

 closely related to 2-dimensional Topologica Quantum Field Theories (TQFTs) [Dij89, Koc04], and can be stated as follows.

・ロト・日本・モート モー うへぐ

Theorem

The free Frobenius category \mathbf{F} on one object generator is equivalent to the two following categories.

1. The category of bounded Riemann surfaces up to a homeomorphism

Objects:finite disjoint unions of m circlesMaps:A map $m \rightarrow n$ is a Riemann surface (with boundary) whose
boundary is the disjoint sum m + n,
Two surfaces are identified modulo homeomorphism.Composition:gluing, forgetting the boundaries in the middle
Thin:Thin:every connected component has a nonempty boundary

- 2. The category of finitary graphs (the node set is finite), up to a homology
- Objects: finite sets $[m] = \{0, 1, \dots, m-1\}$, seen as discrete topological spaces
- Maps: $[m] \rightarrow [n]$ is a topological graph G (i.e. a CW-complex of dimension one), with an injective function $[m + n] \rightarrow G$ Two graphs are identified if they are equivalent modulo homology Composition: also gluing.
 - Thin: every connected components of G is in the image of the injective function $[m + n] \rightarrow G$

- A free Frobenius category is defined only up to equivalence of categories, with the standard universal property associated to that situation
- The two characterizations in Theorem 3 happen to be skeletal categories and are isomorphic
- Our nonstandard notion of Frobenius category requires thinness; maps in the standard, non-thin free Frobenius category can contain several "floating" components that do not touch the border.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Since homology is much more technical than homotopy, we prefer to replace the second result above with:

- 2'. The category of finitary graphs, up to a *homotopy*
- Objects: finite sets $[m] = \{0, 1, \dots, m-1\}$, seen as discrete topological spaces
 - Maps: $[m] \rightarrow [n]$ is a topological graph G (i.e. a CW-complex of dimension one), with an injective function $[m + n] \rightarrow G$ Two graphs are identified if they are equivalent modulo *homotopy* in (m + n)/Top, where homotopies are defined to be constant on [m + n].

Composition: gluing.

Thin: every connected components of G is in the image of the injective function $[m + n] \rightarrow G$

Every map in **F** can be represented by a graph *G* of the following form, where every connected component is a "star" whose central node has *n* loops attached to it, with $n \ge 0$.

Fig. 2. Composition.

Proposition

The category **F** is compact-closed, the dual of an object being the object itself. More generally, *any* Frobenius category is compact-closed.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・

∃ \(\0 \Q \Q \Q)

Definition (Linking)

We define a *linking* to be a triple

$$P = (P, Comp_P, Gen_P)$$

where

- P is a finite set
- Comp_P is the set of classes of a partition of the set P. Its elements are called components.
- ▶ the function $Gen_P : Comp_P \to \mathbb{N}$ (called *genus*) assigns a natural number to each component in $Comp_P$

A map $m \rightarrow n$ in **F** can be described as a linking on the set m + n.

The relevance of the "Frobenius equations" for proof theory is due to the fact that they address the contraction-against-contraction case in cut elimination

$$\frac{\overline{\vdash \overline{\mathbf{a}}, \mathbf{a}} \quad Ax \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}}}{\underline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Contr \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}}}{\underline{\vdash \overline{\mathbf{a}}, \overline{\mathbf{a}}, \mathbf{a}} \quad Contr \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \mathbf{a}, \mathbf{a}}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Contr \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}}} \quad Cut \quad \overline{\vdash \overline{\mathbf{a}}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}} \quad Cut \quad \overline{\vdash \mathbf{a}, \mathbf{a}, \mathbf{a}, \overline{\mathbf{a}}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}, \mathbf{a}} \quad Cut \quad \overline{\top \mathbf{$$

Fig. 3. Two proofs identified by Frobenius equations

Definition (F-prenet)

We define an F-prenet to be a pair

 $P \triangleright \Gamma$

where

- Γ is a sequent
- ▶ P = (P, Comp_P, Gen_P) is a linking
- there is a bijection between the underlying set P and the set of literals of Γ (for which there is no need to make it explicit)
- every class in Comp_P contains only atoms of the same type and their negations.

Fix a calculus: the calculus CL [LS05]

$$\begin{array}{c} \overline{\vdash \overline{\mathbf{a}}, \overline{\mathbf{a}}} & Ax \\ \\ \overline{\vdash \Gamma, A, B} & \lor & \overline{\vdash \Gamma, A \vdash B, \Sigma} \\ \overline{\vdash \Gamma, A \lor B} & \lor & \overline{\vdash \Gamma, A \land B, \Sigma} & \land \\ \\ \hline \begin{array}{c} \frac{\vdash \Gamma, A, \vdash \overline{A}, \Sigma}{\vdash \Gamma, \Sigma} & Cut \\ \\ \hline \end{array} \\ \\ \hline \begin{array}{c} \frac{\vdash \Gamma, A, A}{\vdash \Gamma, A} & Contr & \frac{\vdash \Gamma}{\vdash \Gamma, A} & Weak \\ \\ \hline \end{array} \\ \\ \hline \begin{array}{c} \frac{\vdash \Gamma \\ \vdash \Sigma}{\vdash \Gamma, \Sigma} & Mix \\ \end{array} \\ \\ \hline \end{array} \\ \\ \hline \end{array} \\ \hline \end{array} \\ \hline \end{array} \\ \hline \end{array} \\ \hline \end{array}$$

◆□ > ◆□ > ◆豆 > ◆豆 > ̄豆 = のへで

Every *n*-ary introduction rule of CL

$$\frac{\vdash \Gamma_1 \quad \vdash \Gamma_2 \quad \cdots \quad \vdash \Gamma_n}{\vdash \Gamma}$$

can be transformed into a family of *n* morphisms $P_i \triangleright \Gamma_i \rightarrow Q \triangleright \Gamma$ in the following *syntactic category*.

Definition (Syntactic Category)

Let $\mathcal{F}Synt$ have F-prenets for objects, where a map

 $f: P \triangleright \Gamma \to Q \triangleright \Delta$

is given by an ordinary function on the underlying set of literals

$$f: \mathcal{P} \to \mathcal{Q} \qquad (= \mathcal{L}it(\Gamma) \to \mathcal{L}it(\Delta))$$

such that

 for every formula A, f maps Lit(A) to a subset of Lit(Δ) which defines a subformula of a formula in Δ, while preserving the syntactic left-right order on literals.

for every C ∈ Comp_P, one has that f(C) ⊆ Lit(Δ) is contained in a component C' ∈ Comp_Q, with Gen_P(C) ≤ Gen_Q(C').

Definition

In the category $\mathcal{F}Synt$, we define the families of cospans Mix and \wedge to be

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

where Q is $P_I \uplus P_r(\Gamma \lor \Gamma, A \lor A \lor A, B \lor B \lor B)$.

Definition

An anodyne map $P \triangleright \Gamma \longrightarrow Q \triangleright \Delta$ is a syntactic map that can be decomposed

$$P \triangleright \Gamma \xrightarrow{\sim} Q \triangleright \Delta_1 \xrightarrow{\vee} \cdots \xrightarrow{\vee} Q \triangleright \Delta_n = \Delta.$$

We write

$$[P \triangleright \Gamma] \longrightarrow P \triangleright \Gamma$$

to denote the anodyne map whose domain is the sequent where all outer disjunctions have been removed.

Definition (Correctness diagram)

A correctness diagram $T : T \rightarrow \mathcal{F}Synt$ is a diagram (functor) of the type

for which:

- 1. the branchings are \wedge and *Mix*-cospans ;
- 2. vertical maps are anodyne;
- 3. every leaf $Q \triangleright \Delta$ is s.t. $Comp_Q = \{\{a, \overline{a}\}, \{x_1\}, \dots, \{x_m\}\}\$ and Gen_Q is 0 everywhere.

Definition (Correct F-nets)

An F-prenet $P \triangleright \Gamma$ is a CL-correct F-net, (or simply an F-net) if it is at the root of a correctness diagram

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

This can be strengthened by forcing the anodyne maps in a correctness diagram always to be \Box -maps.

Theorem (Sequentialization)

Correct F-nets are precisely those F-prenets that come from CL without Cut.

Given a linking P let

- ▶ |P| stand for the size of its underlying set,
- $|Comp_P|$ be the number of components,
- ▶ $|\mathcal{G}en_P|$ be the sum of all genera in *P*, i.e. $|\mathcal{G}en_P| = \sum_{C \in \mathcal{C}omp_P} \mathcal{G}en_P(C)$.

The following observation is crucial to the proof:

Lemma (Counting axiom links in an F-prenet) If an F-prenet $P \triangleright \Gamma$ corresponds to a CL proof, then

 $|Ax| = |P| - |Comp_P| + |Gen_P|,$

where |Ax| is the number of axioms in the proof. (Corollary: any correctness diagram for this proof will have the same number of leaves).

Theorem

Given an F-prenet, its CL-*correctness* (CL-*sequentializability*) *can be checked in finite time, i.e. the* CL-*correctness criterion yields a decision procedure for* CL-*correct F-nets.*

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Strong evidence that the procedure is NP-complete, actually.

Cut:

- ► We define a *cut formula* to be A[⊕]A, where -[⊕]- is a new binary connective that is only allowed to appear as a root in a sequent
- Our original goal is to normalize these prenets with cuts by means of composition in F

[This is quite different to Hyland's [Hyl04]. It more resembles [LS05] with an "interaction category" construction [Hyl04, Section 3] on sets and relations, where composition is defined by the means of a trace operator]

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ● ● ●

Immediate problems:

For the resulting F-prenet to come from a proof we need the singleton component to come from a weakening, but this cannot happen according to our interpretation since its genus is > 0.

ヘロン 人間 とくほとう ほとう

These issues can be dealt with by changing the deductive system and we define a new sound and complete calculus for classical logic, FL.

Fig. 4. System FL. (\Box) (\Box)

- The stoup keeps track of the part that is sure to come from weakening and to allow the introduction of arbitrary linking configurations
- The intended interpretation of MulWeak is adding to the linking a single component of genus zero

- Correctness for FL needs to accommodate the new connective for cut,
- We introduce another cospan in the syntactic category of F-prenets $\mathcal{F}Synt$
- We relax the definition of anodyne map to allow for

$$P \triangleright \Gamma \longrightarrow P \uplus Q \triangleright \Delta$$

- The sequentializability theorem and the correctness procedure are restated
- ▶ This time, for FL-correct net we have $|Ax| \leq |P| |Comp_P| + |Gen_P|$.

- F-prenets do form a category which is equivalent to the free Frobenius category generated by the set of literal types (an atom and its negation have the same "type")
- We can consider FL-correct (and CL-correct) nets to be a class of maps in that category, which is not closed under composition.

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Some examples:

Correct F-prenets are calculus-dependent

Minimal amount of loops that need to be added is not uniquely determined...

... and it depends on the order in which normalization is done \mathbb{R} , \mathbb{R} , \mathbb{R} , \mathbb{R} , \mathbb{R}

Definition

For an F-prenet $P \triangleright \Gamma$ for which every switching yields a component with atoms of opposite polarity, we say that is a *sound* net.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Appears as the Lamarche-Strassburger condition on \mathbb{B} -nets in [LS05].

Proposition A (CL- / FL-) correct F-net is sound.

Theorem Sound F-prenets define a category. The large category of F-prenets (as usual objects are formulas and a map $A\to B$ is a $P \triangleright \overline{A}, B)$ has an order enrichment.

Definition

Let $P \triangleright \Gamma$, $Q \triangleright \Gamma$ be two linkings over the same sequent. We write

 $P \leqslant Q$

(日) (日) (日) (日) (日) (日) (日) (日)

if

- $\blacktriangleright \quad Comp_P = Comp_Q \text{ and }$
- ▶ $Gen_P \leq Gen_Q$, i.e, the genus functions are ordered pointwise.

Theorem

The set of FL-correct nets is up-closed under the \leq order.

Theorem

Let $P \triangleright \Gamma$ be a sound net. Then there exists an FL-correct linking $Q \ge P$.

So we can obtain a category by cheating on our original goal and define a composition that "fattens" the one given by ordinary Frobenius categories.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Definition

- F-prenet $P \triangleright \Gamma$
- $| \wedge |$ the number of conjunctions
- |Γ|- the number of literals in Γ.
 We define a *bonus* to be the value

$$\mathsf{B}(P \triangleright \Gamma) = |\wedge| \cdot |\Gamma| \cdot \frac{3^{|\wedge|+1} - 1}{2}$$

- $[P \triangleright \Gamma]^B$ is obtained by adding $B(P \triangleright \Gamma)$ many loops to every component of $P \triangleright \Gamma$,
- $[P \triangleright \Gamma]_B$ be the F-prenet obtained by subtracting $B(P \triangleright \Gamma)$ many loops from every component of $P \triangleright \Gamma$, if possible, $P \triangleright \Gamma$ otherwise.

Theorem

For every sound net $P \triangleright \Gamma$, $[P \triangleright \Gamma]^B$ is FL-correct.

Definition Define:

$$(P \triangleright \Gamma, A) \diamond (Q \triangleright \overline{A}, \Sigma) = \begin{cases} (P \triangleright \Gamma, A) \circ (Q \triangleright \overline{A}, \Sigma), & \text{if } (P \triangleright \Gamma, A) \circ (Q \triangleright \overline{A}, \Sigma) \\ & \text{is either } P \triangleright \Gamma, A \text{ or } \\ Q \triangleright \overline{A}, \Sigma \\ & \left[\lfloor P \triangleright \Gamma, A \rfloor_{B} \circ \lfloor Q \triangleright \overline{A}, \Sigma \rfloor_{B} \right]^{B}, & \text{otherwise} \end{cases}$$

where the \circ is the standard "Frobenius" composition.

Theorem

The \diamond composition of two correct F-nets yields a correct net, it is associative and has a unit for each F-prenet.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Theorem

Every F-prenet in the category of sound F-prenets is obtained by cut elimination/Frobenius composition applied on correct F-nets.

Thank you!
